Server Components

You can install Privilege Manager server components using a script. You can also install components manually one-by-one to split server components between several servers.

To install server components:

1. Extract the installation media to a local folder on the server.

2. If you are installing all Privilege Manager server components on a single server, run 'Installation Media\Server\Install.cmd' with administrative permissions.

This installation script will start required server component installations.

For manual installation, deploy components in the following order:

1. Privilege Manager Portal: Also creates Privilege Manager database to the SQL server specified during the installation
2. Recast Agent Gateway
3. Recast Agent: Required if Recast Agent Gateway is installed on the server
4. Privilege Manager Client: Required if Recast Agent Gateway is installed on the server

---

NOTE: The Recast Agent and Privilege Manager Client are needed on Recast Agent Gateway for automated Privilege Manager client cleanup and random password regeneration.
